The present invention relates to a method for ameliorating the effects of akin disorders. The method comprises contacting the skin with an antisense oligomucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotides of the present invention (see AAF45151 and AAF45151 olifothyosis, pityriasis, ruba, pliaris, serborrhoea, Keloids, keratosis, inchthyosis, pityriasis, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood Sequence 15 BP; 0 A; 7 C; 0 G; 8 T; 0 U; 0 Other; vessels or any other hyperplasia

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 8; Page 90; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticonders. The method comprises contacting the skin with an acceptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation.

CC inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectide which can be used to mention (see AAF45151 and AAF45133-CC ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a neoplasias, scleroderma, warts, benign growths, cancers of the kin, a hypernecvascular condition such as a neovascular condition of the retina, disease, kidney disease, hyperproliferation of the inside of blood customers.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, or inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can for ameliorating the effects of psoriasis, F45161). The method is useful for ameliorating the effects of psoriasis, index, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, the brain or skin, growth factor—mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin discorder; Insulin-like Growth Factor.                                                                                                                                                                                                                                                                                                                ö
                                 The present invention relates to a method for ameliorating the effects of akin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGP]) receptor; IGF binding protein [IGFBP] 2 or IGFBPB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present equence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF4151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pliaris, serborrhoea, keloids, keratosis, ineoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic vessels or any other hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense therapy, antiproliferative, antinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor; IGFP-1; pityriasis; IGF binding protein, IGFBP-2; IGFBP3; inflammation, psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keatosis; neoplasia; scaleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; necovascular condition; hyperplasia; kidney disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method for ameliorating the effects of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonaleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBPB), which is capable of inhibiting or reducing growth factor mediated cell proliferation,
akin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFB]-3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, hyperneovascular condition such as a neovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense therapy, antiproliferative, antinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, lisulin-like Growth Factor I receptor; IGF-1; pityriasis, IGF binding protein, IGFBP-2; IGFBP3; inflammation, psoriasis, pitaris, growth factor mediated cell proliferation, ichthyosis, serborrhoea, ruba, keratosis, neophasia, scleroderma, wart, skin cancer; sclerotic disease, hypermeovascular condition; hyperplasia, kidney disease, neovascular condition; hyperplasia, kidney disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              당
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAP45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antiesnes oligonucleotide, (for Insulin-like Growth Factor [1GF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBPB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense of oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pivyriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, bengm growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense therapy, antiproliferative, antinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor; IGF-1; pityriasis, IGF binding protein, IGFBP-2; IGFBP3; inflammation, psoriasis; pilaris, growth factor mediated cell proliferation, ichthyosis; serborrhoea, ruba, kearcosis, neoplasia; scleroderma, wart, skin cancer; sclerotic disease, hyperneovascular condition; hyperpassa, kidney disease; neovascular condition; hyperpassa, kidney disease;
ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperpoliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                            Gaps

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticonse oligomucleotide, (for Insulin-like Growth Factor [168]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotide which can be used to design the affects of psoriasis, F45161). The method is useful for ameliorating the effects of psoriasis, cichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, cheases, kidney disease, hyperproliferation of the inside of blood to sessels or any other hyperplasia
                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense therapy, antiproliferative, antiinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor; IGF-1, pityriasis, IGF binding protein, IGFBP-2, IGFBF3, inflammation, psoriasis, pilatis, growth factor mediated cell proliferation, ichthyosis, serborrhoea, ruba, keratosis, neophasia, scleroderma, wart, skin cancer; sclerotic disease, hyperneovascular condition, hyperplasia, kidney disease, neovascular condition, hyperplasia, kidney disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                              Gaps
disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia

The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] -2 or IGFBPB, which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present esquence is an oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153 oligonuclectides of the present invention (see AAF45151 and AAF45153 oligonuclectides of the present invention (see AAF45151 and AAF45153 oligonuclectides of the present invention (see AAF45151 and AAF45153 oligonuclectides of the present invention (see AAF45151 and AAF45153 oligonuclectides of the present invention (see AAF45151 and AAF45153 oligonuclectides of the relation, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a neoplasias, kidney disease, hypergroliferation of the inside of blood

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method for ameliorating the effects of action disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF] and receptor, IGF binding protein [IGFBP] - or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF$151 and AAF$153-P$5161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

```

The present invention relates to a method for ameliorating the effects of akin disorders. The method comprises contacting the skin with an antisense Oligonucleotide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] - or IGFBPB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 olichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovacular condition ouch as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hyperproliferation of the inside of blood Sequence 15 BP; 3 A; 7 C; 3 G; 2 T; 0 U; 0 Other; vessels or any other hyperplasia

IGF-I oligonucleotide #1070

```
The present invention relates to a method for ameliorating the effects of antisense chizotærs. The method comprises contacting the skin with an antisense chigonucleotide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] - 2 or IGFBP3), which is capable inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45151). P45161). The method is useful for ameliotating the effects of psoriasis, ichthyosis, pityriasis, ruba, pitaris, serborrhoea, Keloids, keratosis, hyperneovascular condition such as a necvascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
Antisense therapy, antiproliferative, antinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding procein, IGFBP-2; IGFBP3; inflammation, psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba, keratosis; neoplasia; scleroderma, wart; skin cancer; sclerotic disease; hypermeovascular condition, hyperpleas, kidney disease; neoblarion of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

Antisense therapy, antiproliferative; antinflammatory; antipsoriatic; cytostatic; dermatological, cardiant; virucide; ophthalmological, keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding procein; IGFB-2; IGFBF3; inflammation; psoriasis; pitaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; kearcosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neovascular condition of the retina; ss.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticopacification in the form of Growth Factor [168]-1 receptor, 1GF binding protein [16FBP]-2 or 1GFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, or inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectide is useful for ameliorating the effects of psoriasis. F45161). The method is useful for ameliorating the effects of psoriasis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hypernecvascular condition such as a neovascular condition of the retina, the brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperplasia Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation. growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neovascular condition of the retina; ss. ```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomuclecide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomuclectide which can be used to design the antisense oligomuclectides of the present invention (see AAF$5151 and AAF$5153-$45161. The method is useful for ameliotrating the effects of psoriasis, inthhyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovacular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperprovacular condition of the retina, disease, hyperprovacular condition of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; seth disorder; insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keatooisis, neoplasia; solaroderma; wart; skin cancer; sclerotic disease; hypermeovascular condition; hyperplasia; kidney disease; neovascular condition of the retina; ss.
                                                                                                                                                                                                                                                                                                                                       Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for ameliorating the effects of antisense oligonuclectide, (for Insulin-like Growth Factor [IGF].

receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing protein [IGFBP]-2 or IGFBP3), which is capable of inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF4151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pliaris, serborrhoea, keloids, keratosis, ineoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense therapy, antiproliferative, antiinflammatory, antipsoriatic, cytostatic, dermatological; cardiant; virucide, ophthalmological; keloid, skin discorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding proctein; IGFBP-2; IGFBB3; inflammation; psoriasis; pilatis; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; kearcosis; neophasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplamis, kidney disease; neobactic of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                               Asking disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBF]-2 or IGFBF], which is capable of inhibiting or reducing growth factor method cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, varts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, the performancies of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                             present invention relates to a method for ameliorating the effects of
                                                                                                                    Edmondson SR;

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Pactor [168]-1 receptor, IGF binding protein [1678]-2 or IGFBR3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the effects of psoriasis, F45161. The method is useful for ameliorating the effects of psoriasis, neoplasias, soleroderma, wats, beingn growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, by byearneovascular condition of the retina, disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                        Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Antisense therapy, antiproliferative, antinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding procein, IGFBP-2; IGFBP3; inflammation, psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neophasia; solaroderma; wart; skin cancer; sclerotic disease; hypermeowascular condition; hyperplasis; kidney disease; neobvascular condition of the retina; ssi
                                                                                                                                                                                                                                                                                     The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-1ke Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliotrating the effects of psoriasis, ichthyosis, pityriasis, ruba, plaaris, serborrhoea, Keloids, keratosis, chophasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                            Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0.5%; Score 10.8; DB 1; Length 15; 85.7%; Pred.                                                                      The present invention relates to a method for ameliorating the effects of antisense or antisense contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAF4151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, inchthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ineoplasias scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense therapy, antiproliferative, antinflammatory, antipsoriatic; cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor; IGFP-1; pityriasis; IGF binding procein, IGFBP-2; IGFBP3; inflammation, psoriasis, pityriasis, growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neovascular condition of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor (IGF)-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectide which is useful for ameliorating the effects of psorisasis, rethylosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 15 BP; 4 A; 4 C; 5 G; 2 T; 0 U; 0 Other;

inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense of an oligonucleotide which can be used to design the antisense AP45151 and oligonucleotides of the present invention (see AA45151 and AA45153-F45161). The method is useful for ameliorating the effects of psoriasis, inchthyosis, pityriasis, tuba, pilaris, serborthoea, keloids, keratosis, neoplasiss, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperpoliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense therapy, antiproliferative, antiinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, insulin-like Growth Factor I receptor; IGFP-1, pityriasis; IGF binding protein, IGFBP-2, IGFBP3, inflammation, psoriasis; pilaris, growth factor mediated cell proliferation, ichthyosis, serborrhoea; ruba, keardosis, neoplasia, scleroderma, wart, skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia, kidney disease; necovascular condition; hyperplasia, kidney disease;
                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomucleotide, (for Insular-like Growth Factors [IGF]-1 receptor, IGF binding protein [IGFB9]-2 or IGFB93), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotide which can be useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, sechornhoea, kelolids, keatosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina,
F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomucleotide, (for Insulin-like Growth Factor [108]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotide which can be used to design the antisense oligomucleotide which can be used to design the effects of psoriasis, chthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, nepplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, branch factor—mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia

The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBF]-2 or IGFBF], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other discorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF4SIS)-F45161). The method is useful for maniforating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, ranners of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for ameliorating the effects

The method comprises contacting the skin with an antisense oligomucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovacular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]) in receptor, IGF binding protein [IGFBP] - 2 or IGFBP3), which is capable of infilammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF4151 and AAF45153-P45161). The method is useful for ameliorating the effects of psoriasis, neoplasias, scleroderma, warts, benign growths, cancers of the skin a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperprolection of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 15 BP; 4 A; 5 C; 2 G; 4 T; 0 U; 0 Other;

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticontaction disorders. The method comprises contacting the skin with an receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an inflammation is useful for ameliorating the effects of psoriasis, chinyosis, pityriasis, ruba, pitaris, serborrhoea, keloids, keratosis, neoplasis, soleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, disease, kidney disease, hyperproliferation of the inside of blood to vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

ó,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF].

receptor, IGF binding protein [IGFBB]-2 or IGFBB3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, plaris, serborrhoea, keloids, keratosis, chopharias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hidney disease, hyperproliferation of the inside of blood
                                                                                         Antisense therapy, antiproliferative, antiinflammatory, antipsoriatic, cytostatic; dermatological; cardiant; virucide, ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pittyriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keardosis; neophasia; scleroderma; wart; skin cancer; sclerotic disease; hypermeowascular condition; hyperplasia; kidney disease; neobascular condition; hyperplasia; kidney disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Human TNFRSF11B gene ASO probe, SEQ 1D NO:

```
The present sequence is a probe used to detect polymorphisms in the human osteoclastogenesis inhibitory factor (TNRRSF11B). Polymucleotides comprising one or more of twenty four novel single nucleotide polymorphisms in the TNRRSF1B gene have been identified. TNRRSF1B regulate osteoclast recruitment and function. An understanding of variations in the gene should thus be useful in developing new therapies for metabolic disorders caused by abnormal osteoclast recruitment and function such as osteoporosis, metastatic bone disease, Paget's disease, rheumatoid arthritis and periodontal bone disease
                                                                                                                                                                                                                                                                                                                                                                      Human Osteoclastogenesis Inhibitory Factor nucleotides, comprising single nucleotide polymorphisms, useful for studying e.g. osteoporosis, Paget's disease and rheumatoid arthritis.

The present sequence is a probe used to detect polymorphisms in the human osteoclastogenesis inhibitory factor (TNFRSF11B). Polymucleotides comprising one or more of twenty four novel single nucleotide polymorphisms in the TNFRSF11B gene have been identified. TNFRSF11B regulate osteoclast recruitment and function. An understanding of variations in the gene should thus be useful in developing new therapies for metabolic disorders caused by abnormal osteoclast recruitment and function such as osteoporosis, metastatic bone disease, raget's disease, rheumatoid arthritis and periodontal bone disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human Osteoclastogenesis Inhibitory Factor nucleotides, comprising single nucleotide polymorphisms, useful for studying e.g. osteoporosis, Paget's disease and rheumatoid arthritis.
                                                                                                                                                                                                                                                          The present sequence is a probe used to detect polymorphisms in the human osteoclastogenesis inhibitory factor (TNFRSF118). Polymucleotides comprising one or more of twenty four novel single nucleotide polymorphisms in the TNFRSF118 gene have been identified. TNFRSF118 regulate osteoclast recruitment and function. An understanding of variations in the gene should thus be useful in developing new therapies for metabolic disorders caused by abnormal osteoclast recruitment and function such as osteoporosis, metastatic bone disease, Paget's disease, rheumatoid arthritis and periodontal bone disease
                                                                                                                                                       Human Osteoclastogenesis Inhibitory Factor nucleotides, comprising single nucleotide polymorphisms, useful for studying e.g. osteoporosis, Paget's disease and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, TNPRSF11B, osteoclastogenesis inhibitory factor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides the protein, cDNA and genomic sequences of human interfleukin-13 (ILI3), and describes the single muoleotide polymorphisms (SNPs) found within the gene, which is found on chromosome 5q31. ILI3 is a pro-inflammatory cytokine thought to be involved in the pathogenesis of sathma and other immune and inflammatory diseases. The ILI3 sequences and the SNPs identified can be used in drug screening, to determine an individual's susceptibility to disease, in forensic and paternity testing, and to identify treatments for anore, immune and inflammatory diseases, including asthma and diseases characterised by fibrosis. The present sequence is an ILI3 allele-specific oligonucleotide
                                                                                                                                                                                                                                                                                                                                                     Human, interleukin-13, ILL3, single nucleotide polymorphism; SNP; cancer; inflammation, immune disorder; cytokine; asthma; chromosome 5q31; fibrosis; forensic; disease susceptibility; drug screening; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel polynucleotide comprising single nucleotide polymorphisms in human interleukin-13 gene is useful for studying expression and function of interleukin-13, as well as diagnosing and treating cancer, inflammatory, and immune disorders.

Producing copies of specific nucleic acids in vitro, without the need of intermediate structures, useful for determining if samples have come from living or dead organisms.
                                                                                                                                                                                                                                                         The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as the arterial confirmation of detect the presence of test of crohn's disease. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, patentity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            M13mp18; living organism; dead organism; nucleic acid copying; isostatic condition; temperature; buffer; ionic strength; PCR primer; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method for producing, in vitro, copies
                                                                                                                                                        Testing for the presence of polymorphisms associated with inflammatory bowel disease, using a hybridization assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ó
                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel nucleotide carrier with probes used for diagnosis of oral diseases, particularly paradontitis, but also caries, especially to identify genetic predisposition (as indicated by polymorphisms) to disease and to identify causative microorganisms or their associated virulence factors and antibiotic resistance genes, e.g. for selection of therapy and for prognosis. They are also useful for research into oral infections. The carriers allow simultaneous detection of both host and pathogen parameters, providing quickly and simply an individual's paradontitis profile, including detection of pathogens that are associated with increased risk of coronary heart diseases and/or aggravation of mother cymptoms, and of opportunistic pathogens. ABX03870-ABX04044 represent DNA fragments used to illustrate the method of the invention (Updated on 06-AUG-2003 to correct OS field.) (Updated

of a specific nucleic acid. The process does not require the use of intermediate structures for the production of the nucleic acid. The method comprises: (a) providing a nucleic acid sample containing the specific sequence, (b) concacting the sample with a mixture containing: (i) nucleic acid precursors; (ii) specific nucleic acid primars, each complementary to a distrinct region of the sequence; and (iii) a nucleic acid producing catalyst; and (c) allowing the mixture to react under isostatic conditions of temperature, buffer and ionic strength. The method can be used for producing copies of specific nucleic acids in vitro. The process can be used to determine if a specific target nucleic acid was derived from a living or deceased organism. The present sequence represents a PCR primer for the Milmpls nucleotide sequence which is used in an example from the present invention. (Updated on 11-SEP-2003 to

Duda A, Nandabalan K,

Claim 15; Page 23; 135pp; English.

The present invention describes polynucleotides comprising single mucleotide polynucphisms (SNPs) in the human dopemaine receptor D2 (DRD2). The polynucleotides may be used in assays to detect and characterise polymorphisms in DRD2 that affect its expression and activity and are prolymorphisms in DRD2 that affect its expression and activity and are involved in disorders such as schlizophrenia, Parkinson's and myoclonus dystonia (MD). This information would be useful for studying the biological function of DRD2 as well as in identifying drugs targeting this protein for the treatment of disorders related to its abnormal expression or function. Polymorphisms in the DRD2 gene affect the expression of active and functional polypeptides. Therefore it is

```
ö
advantageous to detect polymorphisms in the DRD2 gene and how those polymorphisms are combined in different copies of the gene. AAF70261 to AAF70305 represent human DRD2 allele specific oligonucleotide probes, and AAF70309 to AAF70404 represent human DRD2 allele specific oligonucleotide primers which are used in the detection of DRD2 polymorphisms. AAF70405 to AAF70452 represent oligonucleotide primers for the derection of human DRD2 polymorphisms which are given in the exemplification of human DRD2 polymorphisms which are given in the exemplification of the present invention. AAF70453 to AAF70538 represent PCR primers for the human DRD2 gene which are used in examples from the present invention
                                                                                                                                                                                                                                                                                                                                                                    Gaps

New isolated polynucleotide useful for the identification of therapeutics in allergic diseases is new

Claim 15; Page 44; 188pp; English.

The present invention relates to polymorphisms of the human interleukin 4 receptor-alpha gene (IL4R-alpha; see AAF57718 for the reference asquence). Polymorpic comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular IL4Ralpha protein isoform, an expression vector encoding the isoform may be administered to the patient. It may desirable to decrease or block expression of a particular II4Ralpha protein isoform, and the appearance or block expression of a particular II4Ralpha isogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high leaves of untranslatable mRMA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a probe for human IL4R-alpha

The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotronin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing a recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonuclectide is used to detect a polymorphism in the SLC6A4
Solute carrier family 6 neurotransmiter transporter, sectonin 4; SLC6A4; genotyping; allele specific oligonuclectide; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing a recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC6A4

This invention describes a novel DNA sequence, encoding a synthetic spider silk protein, comprising modules, each comprising a group of sequentially arranged oligonucleotides, each coligonucleotide encoding a repeating unit of a spidroin protein. Synthetic protein has at least of repeating unit of a spidroin protein. Psynthetic protein has at least of produce synthetic fibres, films and/or membranes, particularly: (i) for medical use, especially to close wounds and/or to support or cover artificial organs; (ii) as adhesion surfaces for culturing cells; and artificial organs; (ii) as adhesion surfaces for culturing cells; and (iii) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibre with excellent mechanical properties (strength and elasticity). Also they retain water solubility after long-term boiling in aqueous colluctors and since they are also soluble in organic solvents but precipitated at high salt concentration, they are easily extracted and purification or addilate solubility. This sequence represents a N. clavipes spidroin-I derived oligonucleotide used as a repetitive unit in the design of the synthetic proteins described in the invention New DNA encoding synthetic spider silk protein, useful e.g. for closing wounds, comprises modules that encode repeating units of spirodoin Claim 2; Page 14; 88pp; German. proteins.

Identifying strain of prokaryote or individual of eukaryote, useful in clinical laboratories for strain identification of pathogenic bacteria,

The present invention relates to a new method of identifying strain of prokaryote or individual of eukaryote. This method involves amplifying a chighly conserved region (HCR) of ribosomal DNA of prokaryote or entaryote, where the HCR of DNA flanks a highly variable region (HVR) of entaryote, where the HCR of DNA flanks a highly variable region (HVR) of fragments that are separated fragmented to yield labelled, amplified DNA reguences which are labelled, and considerably and consideration of an eukaryote or entaryote or an individual of an eukaryote or the method is preferably useful for invention can be used for identifying a strain of a prokaryote or an individual of fractions, such species and the differences methicillin-resistant Staphylococcus aureus. The method is useful for identifying different bacterial strains involved in e.g. nosocomial confections, and for identifying species, sub-species and the differences between the individuals of the sub-species and the differences between the individuals of the sub-species such as pedigrees, with respect to a eukaryote. The method is sensitive enough to detect differences between e.g. Dacterial isolates of the same species. The method ence of protect individuals of the sub-species such as pedigrees, with more particularly, upon a type of DNA fingerprinting of multiple segments of DNA. The methods are beneficial in clinical laboratories, because they allow for rapid strain identification of pathogenic bacterial DNA is used. The method also provides results with great speed e.g. a preliminary screen by agarcse of provides results with great speed e.g. a preliminary screen by agarcse of completed 5-6 hours after receiving hospital isolates. The preliminary screen by greated of nosocomial infections, rather than having analysis (RPLP) The speed of the methods of the invention, as described above correspectively. The present uncleif adone retrospectively. The present multiple sequence ceptures and prevent the spread of nosocomial infections, rather than having analy Claim 1; Col 26; 31pp; English.

ö haplotyping and genotyping methods are useful for studying population diversity, anthropological lineage, the significance of diversity and diversity, anthropological lineage, the significance of diversity and lineage at the phenotypic level, paternity testing, forensic applications and for identifying is esponse or susceptibility to disease. In trait such as level of drug response or susceptibility to disease. In addition, the methods for identifying the LCAT haplotypes present in individuals are useful in the development of drugs targeting LCAT. For example, determining the frequency of individual LCAT haplotypes in a population with a specific disease, e.g. Norum disease, will facilitate the development of drugs targeting the LCAT isoform(s) that are most frequent in that disease population. The present nucleic acid sequence represents one of a collection (ABK97478-ABK97491) of allele specific Novel isolated polymorphic variant polynucleotide of lecithin-cholesterol acyltransferase gene, useful for studying expression and biological function of the gene, and for therapeutic, diagnostic or forensic The present invention relates to a new polynucleotide comprising a nucleotide sequence which is a polymorphic variant of a reference sequence for lecithin-cholesterol acyltramsferase (LCAT). The invention is useful for identifying an association between a trait (preferably a clinical response to drug targeting LCAT) and at least one genetype or applocype of LCAT gene. The method of the invention has applicability in developing diagnostic tests and therapeutic treatments for Norum disease fish-eye disease and atherosclerotic cardiovascular disease. The present sequence represents an allele-specific oligonucleotide (ASO) probe which is used for detecting polymorphisms in the human platelet activations. Activating Factor Receptor (FTARP) gene. The gene comprises polymorphic sites referred to as PSI-5 to designate the order in which they are located in the gene. Six isogenes of the PTARP gene exist. The PTARP gene is located on circomesome 1, and contains 1 exon. Polymorphisms PS3 and PS5 have previously been identified. RS3 and PS5 cocur in the coding region. The polymucleotide comprising polymorphisms in the PTARP gene is useful in screening candidate drugs to treat diseases related to PTARP activity, e.g. inflammatory diseases, coronary diseases or cancer. The PTARP isogenes are especially useful for treating these diseases. The methods and haplotypes are useful in improving the efficiency of drug discovery and development processes, or for designing clinical trials of candidate drugs for treating the sedical trials of

```
The present invention relates to a method for amplifying nucleic acid.

The method comprises annealing a primer (PI) to first strand (S1) of denatured target nucleic acid (dNA) at annealing temperature (T1);

catending P1 at T1 or extension temperature (E1) to generate doublestended (ds) nucleic acid, annealing primer (P2) to second strand (S2) of dNA at annealing temperature (T2); extending P2 to generate double.

Cof dNA at annealing temperature (T2); extending P2 to generate doNA;

Cof denaturing target daNA into S1 and S2. A probe hybridisation step may be incorporated into the cycle. A detectable probe is annealed to S2 of denatured target nucleic acid, probe hybridisation step may be incorporated into the cycle. A detectable probe is annealed to S2 of denatured target uncleic and s2. A probe hybridisation digest or a ligation product, or a target comprising single nucleotide polymorphisms. The asynchronous PCR cycle has utility in nuclease cleavage assay with a cleaving DNA flucrescence resonance energy transfer (RRET) probe, in assays for human disease diagnosis, food-borne pathogen detection and microbial detection, for allelic discrimination of target DNA, and in genotyping and gene expression analysis. The present sequence is a PNA FRET probe, which was used to illustrate real-time detection of
                                                                                                                                                                                                                                                                                                       Novel asynchronous thermal cycling method for amplification of target nucleic acid, involves two annealing and two extension steps employing two primers which differ in their thermal melting temperatures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match 0.5%; Score 10.8; DB 1; Length 15; Best Local Similarity 85.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                  The present invention relates to a method for amplifying nucleic acid.

The method comprises annealing a primer (P1) to first strand (S1) of denatured target nucleic acid (ANA) at annealing temperature (T2);

Stranded (ds) nucleic acid, annealing primer (P2) to second strand (S2) of GNA at annealing temperature (T2); extending P2 to generate doublestranded (ds) nucleic acid, annealing primer (P2) to second strand (S2) of GNA at annealing temperature (T2); extending P2 to generate dsNA;

of GNA at annealing temperature (T2); extending P2 to generate dsNA;

chacturing target dsNA into S1 and S2. A probe hybridisation step may be incorporated into the cycle. A detectable probe is annealed to S2 of method is useful for amplifying target nucleic acid, preferably a plasmid, cDNA, amplicon, genomic DNA, restriction digest or a ligation product, or a target comprising single nucleotide polymorphisms. The synchronous PCR cycle has utility in nuclease cleavage assay with a cleaving DNA flucrescence resonance energy transfer (FRET) probe, in assays for human disease diagnosis, food-borne pathogen detection and microbial detection, for allelic discrimination of target DNA, and in genotyping and gene expression analysis. The present sequence is a PNA probe, which was used to illustrate real-time detection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                  Novel asynchronous thermal cycling method for amplification of target nucleic acid, involves two annealing and two extension steps employing two primers which differ in their thermal melting temperatures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PNA, FRET; probe, nucleic acid amplification; peptide nucleic acid, fluorescence resonance energy transfer, disease diagnosis; food-borne pathogen detection; microbial detection; allelic discrimination; genotyping; gene expression analysis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to genetic variants of human angiotensin receptor 2 (AGTR2) isogenes and methods for detecting variants of AGTR2 gene. Polynuclectides of the invention are useful in studying the expression and biological function of AGTR2 and in developing drugs targetting AGTR2 protein. Methods of the invention are useful for studying population diversity, anthropological lineage, the significance of diversity and lineage at the phenotypic level, paternity testing, forensic applications
                                                                                                                                                                                                                                                                                                                                                                                         .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel genetic variants of angiotensin receptor 2 isogenes, useful in therapeutic purposes and in screening for drugs targeting the angiotensin receptor protein.
                                                                                                                        Measurement of nucleic acids, using a nucleic acid probe and analysis of
                                                                                                                                                                                                          This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorescence of the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, angiotensin receptor 2, forensic application, drug response, AGTR2, congenital abnormality of kidney and uninary tract; CAKUT; cardiovascular disorder; premture ovarian failure; gene therapy; POF; polymorphism; ASO; allele-specific oligonucleotide; primer; ss.

ö
and for identifying associations between AGTR2 genetic variations and a trait such as levels of drug response or susceptibility to disease. It is useful in developing diagnostic tests and therapeutic treatments for eardiovesscular disorders, congenital abnormalities of kidney and urinary tract (CAKUT) and premature ovarian failure (POF). The invention is useful in gene therapy. The present sequence is an allele-specific oligonuclectide (ASO) primer used to detect human AGTR2 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Amplifying nucleic acid by synthesizing template nucleic acid containing a predetermined sequence and hairpin structure and using the template for target amplification by Single Primer Amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single Primer Amplification; nested oligonucleotide extension reaction; hairpin; SPA; library; ds.

                                                                                                                                                    g
                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprise at least three 3.-5. linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful for binding not if and in antisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to treating diseases caused by viruses and for diagnostic applications to carcious. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and for modulating target gene expression. They are also useful in gene the conditions are at larget DNA used in the exemplification.
                                                                                                        ö
                                                                                                                                                                                                                                                                                                         Antisense therapy, infection, cardiovascular disorder, immune reaction, gene therapy, virucide, cytostatic, antibacterial, antiinflammatory,
sequence located on the same or different nucleic acid molecules. This polynucleotide sequence represents an oligonucleotide relating to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligomers useful for binding to DNA duplex target sequence and for treating e.g. diseases caused by viruses and inflammatory conditions comprise at least three 3'-5' linked nucleosides.

cardiovascular disorders, immune reactions and bacterial infections and for modulating target gene expression. They are also useful in gene therapy. The present sequence is a target RNA used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3.5 linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful for binding to a DNA duplex target sequence via either CT or GT triplex helix binding morif and in antisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammers, in the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "5-methyl-2'-deoxycytidine; This base is given as N in the sequence shown as SEQ ID NO: 8 in the sequence listing"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         *tag= b

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3'-5' linked nucleosides or their salts, At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful for binding to a DNA duplex target sequence via either CT or GT triplex clix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as pathological conditions are also used as primamatory conditions, cardiovascular disorders, immune reactions and bacterial infections and therapy. The present sequence is an oligonuclectide used in the therapy. The present sequence is an oligonuclectide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense therapy, infection, cardiovascular disorder, immune reaction, gene therapy, virucide, cytostatic, antibacterial, antiinflammatory;
                                                                                                                                                                                                                                                                                                                                                                                            New oligomers useful for binding to DNA duplex target sequence and for treating e.g. diseases caused by viruses and inflammatory conditions comprise at least three 3'-5' linked nucleosides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present invention relates to novel cligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3-5' linked nucleosides or their salts. At least to me internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside comprises a base. Sequence of the invention are useful of the binding to a DNA duplex target sequence via either or or of triplex terating diseases caused by viruses and for diagnostic applications to treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions.

Cardiovascular disorders, immune reactions and bacterial infections and condulating target gene expression. They are also useful in gene therapy. The present sequence is an oligomucleotide used to generate triple helix structures. This sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /*tag= e

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3.5' linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful to binding to a DNA duplex target sequence via either CT or GT triplex helix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for disquostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and acterial infections and for modulating target gene expression. They are also useful in gene therapy. The present sequence is an oligomucleotide used in the
                                                            /mod_base= OTHER /note= "5-(1-propynyl)-2'-deoxyuridine; This base is given as N in the sequence shown as SEQ ID NO: 31 in the sequence listing"
N in the sequence shown as SEQ ID NO: 31 in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New oligomers useful for binding to DNA duplex target sequence and for treating e.g. diseases caused by viruses and inflammatory conditions comprise at least three 3'-5' linked nucleosides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gutierrez AJ;

```
The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3.-5. linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequence of the invention are useful for binding to a DNA duplex target sequence wit either or or of triplex treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and condulating target gene expression. They are also useful in gene therapy. The present sequence is an oligomicleotide used to generate duplex structures. This sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense therapy; infection; cardiovascular disorder; immune reaction; gene therapy; virucide; cytostatic; antibacterial; antiinflammatory; cancer; cardiant; DNA-RNA hybrid; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ઠ
                                            The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprise at least three 3'-5' linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodisester linkage and at least one internucleoside linkage is not a phosphodisester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful for binding to a DNA duplex target sequence via either CT or GT triplex helix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for disponsitic applications to treating diseases caused by viruses and for disponsitic applications to ancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cancers immune reactions and bacterial infections and for modulating target gene expression. They are also useful in gene triple helix structures. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "5-(1-propynyl)-2'-deoxycytidine; This base is given as N in the sequence shown as SEQ ID NO: 5 in the sequence listing"

                                                                                                                                   à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprise at least three 3'-5' linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least for binding to a DNA duplex target sequences of the invention are useful for binding to a DNA duplex target sequence via either (T or of triplex helix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pudlo J;
The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprise at least three 3.-5. linked mucleosides or their saits. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful for hinding to a DNA duplex target sequence via either CT or GT triplex helix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for disgnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and therapy. The present sequence is an oligomucleotide useful in gene therapy. The present sequence is an oligomucleotide useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3'-5' linked nucleosides or their sails. At least comprises at least three 3'-5' linked nucleosides or their sails. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside comprises a base. Sequences of the invention are useful for binding to a LNA duplex target sequence is at else used for treating diseases caused by viruses and for disgnostic applications to treating diseases caused by viruses and for disgnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and cardiovascular disorders, immune reactions and bacterial in gene therapy. The present sequence is an oligomicleotide used to generate the present sequence is used in the exemplification of the internal conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3-5' linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one hulleoside comprises a base. Sequences of the invention are useful for binding to a DNA duplex target sequence the aither of or of triplex of theix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and therapy. The present sequence is an oligonucleotide useful in gene therapy. The present sequence is an oligonucleotide used in the

```
The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3.-5. linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequence of the invention are useful for including motif and in anisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and charactular disorders, immune reactions and bacterial infections and therapy. The present sequence is an oligomicleotide used to generate therapy. The present sequence is used in the exemplification of the construction of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /mod_base= OTHER

The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3.-5. linked nucleosides or their sailts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage. Sequences of the invention are useful for binding to a DNA duplex target sequence via either or or off triplex helix binding until and in antisense therapies. They are also used for treating diseases caused by viruses and for disgnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and candulating target gene expression. They are also useful in gene therapy. The present sequence is an oligomicleotide used to generate triple helix structures. This sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                           /*tag= f

                                                                                                                                                                                                                                                                                                                                        The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprise at least three 3-5 linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodicaster linkage and at least one internucleoside comprises a base. Sequences of the invention are useful for inhinging to a DNA duplex target sequence via either CT or GT triplex helix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and therapy. The present sequence is an oligomucleotide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense therapy, infection, cardiovascular disorder, immune reaction, gene therapy, virucide, cytostatic; antibacterial; antiinflammatory; cancer, cardiant, ss.
                                                                                                                                                                                                                 New oligomers useful for binding to DNA duplex target sequence and for treating e.g. diseases caused by viruses and inflammatory conditions comprise at least three 3'-5' linked nucleosides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         THE LITTLE LITTLE SON THE STATE OF THE STATE
```

```
The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprise at least three 3'-5' linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful for hinding motif and in artisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections and for diagnostic applications to detect viral infections and solved as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and conditions the present sequence is an oligomicleotide used to generate therapy. The present sequence is used in the exemplification of triple helix structures. This sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3.-5. linked nucleosides or their saits. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside longrises a base. Sequences of the invention are useful one nucleoside comprises a base. Sequences of the invention are useful that binding motif and in attisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and to modulating target gene expression. They are also useful in gene therapy. The present sequence is used in the exemplification of triple helix structures. This sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense therapy, infection, cardiovascular disorder, immune reaction, gene therapy, virucide, cytostatic, antibacterial, antiinflammatory, cancer, cardiant, ds.
                                                                                                                                                                                                                                                                                                                                          New oligomers useful for binding to DNA duplex target sequence and for treating e.g. diseases caused by viruses and inflammatory conditions comprise at least three 3'-5' linked nucleosides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention describes a method for detecting mutations associated with anti-HIV drug resistance in a patient by detecting at least case one of the mutations K103N/R, V106A/IL, Y181C/I, M184V/I, Y188L, C190A/S/R, T215Y/F/D/S/A and/or O151M/L in the reverse transcriptase (RT) of HIV strains in a biological sample using a specific set of probes optimised to function together in a reverse-hybridisation assay. The method and the nucleic acid sequences used in the method are useful for determining viral mutations and/or polymorphisms in the HIV RT gene associated with resistance. The probes are useful for the genetic detection, preferably in vitro detection of the mutations K103N/R, V106A/IL, V181C/I, Q151M/L, M184V/I, Y188L, G190A/S/R and/or mutation is associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of arriving reliance and process assay or determination and monitoring of arrivinsal drug resistance or mutations associated with drug resistance of viruses containing RT genes. ARZ33759 to ABZ34642 represent HIV RT securing the exemplification of the present
                                                                                             Detecting mutations associated with anti-HIV drug resistance comprises detecting at least one of the mutations in the HIV reverse transcriptase gene by using probes optimized to function together in a reverse-hybridization assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human immunodeficiency virus; HIV; reverse transcriptase; RT; enzyme;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprise at least three 3-5. Innked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequence of the invention are useful for inhaling to a DNA duplex target sequence via either CT or GT triplex helix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and the invention the present sequence is a target DNA used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               o'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human immunodeficiency virus; HIV; reverse transcriptase; RT; enzyme; detection; mutation; anti-HIV drug resistance; polymorphism; resistance;

The present invention describes a method for detecting mutations associated with anti-HIV drug resistance in a patient by detecting at least one of the mutations K103N/R, V106A/IL, V18LCI, M18HV/I, Y18EL, C190A/S/R, T215Y/F/D/S/A and/or O151M/L in the reverse transcriptase (RT) of HIV strains in a biological sample using a specific set of probes of HIV strains in a biological sample using a specific set of probes of HIV strains in a biological sample using a specific set of probes of HIV strains in a biological sample using a specific set of probes of HIV strains in a biological sample in the HIV RT generated with resistance. The probes are useful for the genetic detection, preferably in vitro detection of the mutations K103N/R, V106A/IL, Y18IC/I, O151M/L, M184V/I, Y18BL, G190A/S/R and/or T21SY/F/D/SAA in the RT of HIV strains in a biological sample, where the mutation is associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of arbidiates and probes which are used in the exemplification of the present sequences and probes which are used in the exemplification of the present
            Detecting mutations associated with anti-HIV drug resistance comprises detecting at least one of the mutations in the HIV reverse transcriptase gene by using probes optimized to function together in a reverse-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; colon cancer; colorectal cancer; pancreatic cancer; SAGE tag; serial analysis of gene expression; diagnostic; prognostic; probe;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognestic markers of cancer, especially of the colon and panoreas. ABK31900-ABK32770 represent human colon and panoreatic cancer. SAGE tags of the invention

The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   colon and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGB serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABKX1900-ABXX2770 represent human colon and pancreatic cancer SAGE tags of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Probe, polymorphism detection, mutation detection, disease diagnosis, microbial identification, ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABKG1900-ABK23770 represent human colon and pancreatic cancer SAGE tags of the invention
probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer SAGE tags of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                        The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded cligonucleotide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate the invention
                                                                                                                                                                          Fluorescently-labeled nucleic acid probes for assaying nucleic acids and their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and microbial identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Enzymatic nucleic acid; RNA cleavage; Hepatitis C virus infection; HCV ribozyme; HCV expression; HCV replication; cirrhosis; virucide; liver failure; hepatocellular carcinoma; HCV infection; drug therapy; type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon; hepatotropic; autiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme; HCV expression, HCV replication; cirrhosis, virucide, liver failure, hepatocellular carcinoma; HCV infection; drug therapy, type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon; hepatotropic, antiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.
                                                              New ribozymes targeting RNA derived from hepatitis C virus inhibit vireplication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hepatitis C virus substrate #300 for HCV hammerhead ribozyme #300.

                                                                                        The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV cribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent was potation and electronic format directly from the USPFO web site at
                                                                                                                                                                                                                                                                                                                                                 .

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The cargymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprises sequences complementary to one of the substrate sequences defined in the specification. The HCV control of the substrate sequences defined in the specification. The HCV control of the vertical or modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon. The present of interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printing obtained in electionic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ..
0
New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enzymatic nucleic acid; RNA cleavage; Hepatitis C virus infection; HCV ribozyme; HCV expression; HCV replication; cirrhosis; virucide; liver failure; hepatocellular carchinoma; HCV infection; drug therapy; type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon; hepatotropic; autiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.

The present invention relates to enzymatic nucleic acids which concerns and construction to the present invention relates to enzymatic nucleic acid or ribozyme is in a hammerhead (HHV). The concentration nucleic acid or ribozyme is in a hammerhead (HH) or hairpin of the substrate sequences defined in the specification. The HCV of the substrate sequences defined in the specification. The HCV they can be useful for modulating the expression and/or replication of HCV They can be used to treat cirrhosis, liver failure and/or cheptocallular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon. The present connection alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) riboxyme. Note: Some of the sequence data for this patent did not form part of the complete sequence data for this patent was consensus interferor alpha present consensus interferor alpha present consensus interferor consensus consensus interferor consensus c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme, HCV expression, HCV replication, cirrhosis, virucide, liver failure, hepatocellular carcinoma, HCV infection, drug therapy, type I interferon, interferon alpha, interferon beta, cytostatic, interferon gamma; consensus interferon, hepatotropic, antiinflammatory, substrate, hammerhead ribozyme, HH ribozyme, 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hepatitis C virus substrate #949 for HCV hammerhead ribozyme #949.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      y Match 0.5%; Score 10.8; DB 1; Length 15; Local Similarity 78.6%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ద
                                                                                                                                                                                       The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The cargumetic nucleic acid or ribozyme is in a harmerhead (HH). The cargumetic nucleic acid or ribozyme is in a harmerhead (HH). The cargumetic nucleic acid or ribozyme is complementary to one of the substrate sequences defined in the specification. The HCV to or the cargumes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV harmmerhead (HH) ribozyme. Note: Some of the sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme, HCV expression, HCV replication, cirrhosis, virucide, liver failure, hepatocellular carcinoma, HCV infection, drug therapy, type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon, hepatotropic, antiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.

pecifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV cone is useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enzymatic nucleic acid; RNA cleavage; Hepatitis C virus infection; HCV ribozyme; HCV expression; HCV replication; cirrhosis; virucide; liver failure; hepatocellular carcinoma; HCV infection; drug therapy; type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon; hepatocropic; antiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.

enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication bepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the published specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the human neuropeptide Y (NPY) gene and single nucleotide polymorphisms (SNPs) identified therein. The sequence can be used in the treatment of disorders associated with NPY, including atherosclerosis, obesity, psychological disorders and alcoholism. The present sequence is an allele specific probe used to isolate the human

The invention relates to a novel polymorphic variant of a sequence of CYPA1 protein or its fragment. The polymorphic wariants are useful in studying the expression and function of CYP7A1, in expressing CYP7A1 protein for use in screening candidate drugs to treat diseases related to CYP7A1 activity, in studying the binding affinity of candidate drugs to reset of cardidate drugs targeting cYP7A1 for the treatment of disorders such as cholesterol and bile disorders. Haplotyping methods are useful in validating CYP7A1 as a candidate target for treating a specific condition or disease predicted to associated with CYP7A1 activity, or in the dealing of candidate drugs for treating a specific condition or disease by second with CYP7A1 activity, or in the dealing of candidate drugs for treating a specific condition or disease associated with CYP7A1 activity, such as cirrhosis, familial trials of candidate drugs for treating a cirrhosis, familial and also useful for studying expression of the CYP7A1 isogenes in vivo, for in vivo screening and testing of drugs targeted against CYP7A1 protein, and the sting the efficacy of therspeutic agents and compounds related to cholesterol and bile acid metabolism. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New cytochrome P450 subfamily VIIA (cholesterol 7 alphamonooxygenase) polypeptide 1 gene variants, useful for studying the expression and activity of CYP7A1 and screening drugs for treating disorders of cholesterol and bile metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention relates to a novel method for obtaining typing information about several variable sites within target nucleic acid, or typing one or more nucleic acid molecules. The methods of the invention are useful for typing one or more nucleic acid molecules containing two or more variable sites, preferably nucleic acid molecules containing two or more variable variable sites are typed, where three or more primer excension reactions are performed. The method is also useful for diagnosis of pathological conditions characterized by the presence of specific nucleic acid molecule(s). The methods are particularly suited for identifying microbial species or their subtypes, and in typing procedures e.g. typing of polymorphisms, tissue typing or in clinical applications. The sequence of the particularly useful to the cytochrome P450 gene superfamily

The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich trarget sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel contentation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to oligonucleotides can be used to form triple-helices, and are useful to oligonucleotides can be used to form triple-helices, and are useful to coligonucleotides can be used to pathogenic double-stranded DNA including specific sequences required by pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for the oligonucleotide can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral coligonucleotides are capable of forming triple-belics with such sequences in cancer used in the activated or origin. Such therapeutic oligonucleotides are capable of forming triple-belics with such sequences in cancerous cells containing the activated concogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents an oligonucleotide used in the methods of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /mod_base= OTHER

The invention relates to a peptide nucleic acid capable of hybridising to a target sequence of Mycobacterial IDNA, precursor FRNA or FRNA (5S, 16S or 23S) forming detectable hybrids. Also included are detecting a target sequence of mycobacteria in a sample comprising contacting FRNA or FDNA in the sample with peptide nucleic acid probes (hybridisation takes place between the probe and the FRNA or FDNA), observing or measuring any formed detectable hybrids and relating the observation or measurement to the presence of a target sequence of mycobacteria in the sample, and a target sequence of mycobacteria in particular of probes are used for detecting a target sequence of MTC (and distinguishing them from mycobacterial network (mycobacterial sequence of mycobacterial sequence of the mycobacterial sequence of mycobacterial sequence of mycobacterial sequence of the mycobacterial o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transient immortalisation; immortalisation protein; transplant; PCR; primer; ss; cardiant; osteopathic; hepatotropic; antiparkinsonian; organ regeneration; degenerative disease; cardiac infarct; bone degeneration; osteoporosis; liver regeneration; Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide nucleic acid probes for detecting target sequences of Mycobacteria in samples, e.g., sputum, which are capable of hybridizing to a target sequence of mycobacterial rDNA, precursor rRNA or rRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 10.8; DB 1; Length 15;

The present invention relates to a method for the transient immortalisation of cells by introducing immortalisation proteins into treme from the outside. The method is used to immortalise cells cells transiently to allow their expansion, particularly to produce transplant material for regenerating organs, for treating chronic (degenerative) diseases, e.g. in cases of cardiac infarct (with simultaneous reduction in the risk of congestive heart failure and future infarcts) or chronic bone degeneration (osteoporcsis), for regeneration of the liver, for treating Parkinson's disease (using dopaminrsgic cells) and for ex vivo production of heart and venous valves. The present sequence is a PCR primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Triplex DNA; internucleoside linkage; oligonucleotide-based diagnosis; triplex binding; absorption matrix; immobilised enzyme; process control; immunoassay reagent; pendant functionality; cation exchange agent; molecular sieve; textile; fibre; film; formed article; ss; polyfunctional surfactant; triplex affinity capture purification.
                                                                                                                                                                                                                                                Transient immortalization of cells, useful for preparing transplant material and for organ regeneration, by supplying immortalizing proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention describes an oligonucleotide compound with internucleoside linkages comprises at least one nucleoside. The compounds are used in oligonucleotide-based diagnosis to detect presence or absence of target gene sequences to which they specifically bind and separation through triplex binding. They are also useful as linkers or spacers in preparing absorption matrices, immobilised enzymes for process control or immunoasay reagents; as monomers to provide access to polymers having pendant functionalities; as cation exchange agents in the preparation of molecular sieves, textiles, fibres, films and formed articles; and as polyfunctional surfactants. The composition improves triplex affinity capture purification and enhances triplex binding. This sequence represents a novel oligonucleotide capable of binding to a polymucleotide duplex to form a triplex structure useful in diagnosis
                                                                                                                      New oligonucleotide compound with internucleoside linkages useful in oligonucleotide-based diagnosis comprises at least one nucleoside selected from 2-aminopyridine or 2-pyridone C-nucleosides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 15 BP; 0 A; 5 C; 0 G; 10 T; 0 U; 0 Other;

Novel alcohol oxidase I regulatory nucleotide sequences useful for enhancing expression of genes of interest in a variety of host cells, especially yeast cells. enhancing

The present sequence represents a consensus sequence of methanol regulated promoters of methylotrophic yeast. The specification describes Disclosure; Fig 6; 66pp; English

The invention relates to a 2-aminopyridine C-nucleoside or 2-pyridone C-nucleoside compound, its salt, solvates, resolved enantiomers or purified distrements of formula detailed in the specification. Also included is an oligomer compound comprising a multiplicity of nucleosides linked by internucleoside linkages where at least one nucleoside is a modified nucleoside comprising a 2-aminopyridine C-nucleoside is a modified nucleoside, its salts, solvates, resolved enantiomers or purified diastereomers. The oligomer is useful for detecting the presence, absence or amount of a particular DNA duplex in a sample suspected of containing DNA. The method involves contacting the sample with the oligomer under conditions where a triple helix is formed between the oligomer and the and 1 5' useful for preparing oligonucleoside or 2-pyridone C-nucleoside compound specific DNA duplexes in samples. The AOX1 5' regulatory sequences within the alcohol oxidase 1 (AOX1) promoter region. AOX1 catalyses the oxidation of methanol to formaldehyde. The AOX1 promoter is an inducible promoter, primarily induced by methanol starvation, and repressed in response to glucose and ethanol. The AOX1 regulatory sequences can be used to produce expression cassettes and vectors, which are useful for protein production. The regulatory sequences are useful to increase expression of genes of interest in a versiety of host cells, in a research setting to further characterize promoter function and to study peroxisome biogenesis. The invention relates to a 2-aminopyridine C-nucleoside or 2-pyridone C-
concleoside compound, its salt, solvates, resolved enantiomers or purified
confastereomers of formula detailed in the specification. Also included is
concleoside included is
concleoside comprising a multiplicity of nucleosides linked by
internucleoside linkages where at least one nucleoside or 2-pyridone C-
concleoside (omprising a 2-aminopyridine C-nucleoside or 2-pyridone C-
mucleoside, its salts, solvates, resolved enantiomers or purified
diastereomers. The oligomer is useful for detecting the presence, absence
conditions where a triple helix is formed between the oligomer under
conditions where a triple helix is formed between the oligomer under
conditions where a triple helix is formed between the oligomer under
conditions where a triple helix is formed between the oligomer under
conditions where a triple helix is formed between the oligomer and the
particular DNA duplex. The 2-aminopyridine C-nucleoside or 2-pyridone C-
conditions who particular based diagnosis and separation through triplex
binding, as monomers to provide access to polymers having unique pendent
cuseful in oligomucleotide-based diagnosis and separation of
functional ities, as componers with monomers, for preparation of
functional surfactants, as phase transfer agents, in phase transfer
catalysis and liquid/liquid ion extraction, in the synthesis or
catalysis and liquid/liquid ion extraction, in the synthesis or
process control, or immunoasay reagents. The present sequence is a
control probe sequence containing modified nucleotides, used in a DNase
control probe sequence containing modified nucleotides, used in a DNase
control energy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                      Novel 2-aminopyridine C-nucleoside or 2-pyridone C-nucleoside compound useful for preparing oligonucleotides which are used for detecting specific DNA duplexes in samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to a 2-aminopyridine C-nucleoside or 2-pyridone C-nucleoside compound, its salt, solvates, resolved enantiomers or purified diastersomers of formula detailed in the specification. Also included is an oligomer compound comprising a multiplicity of nucleosides linked by incleoside linkages where at least one nucleoside is a modified nucleoside, its salts, solvates, resolved enantiomers or purified diastersomers. The oligomer is useful for detecting the presence, absence or amount of a particular DNA duplex in a sample suspected of containing or amount of a particular DNA duplex in a sample with the oligomer under compations where a triple helix is formed between the oligomer under particular DNA duplex in a sample with the oligomer under containing as monomers to provide access to polymers having unique pendent functionalities, as comenomers with monomers, for preparing polymers binding, as monomers to provide access to polymers having unique pendent functional surfacentie, subsection of molecular sleves, textiles, fibres, films, and formed articles, as comenomers with monomers, for preparing polymers of polyfunctional surfacents, as phase transfer agents in the preparing polymers of the preparing affinity as phase transfer agents in the symbase transfer catalysis and liquid/liquid ion extraction, in the symbasis or resolution of other optically active materials, and as linkers or spacers in preparing affinity absorption matrices, in members a probe property property or immunoassay reagents. The present sequence is a probe acquence containing RNA nucleoides, used in a DNase footprint assay,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô

Nucleic acid molecule, Hepatitis C virus, HCV, Hepatitis B virus, HBV;

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HCV) or Hepatitis B virus (HCV) or And encourage include antisense and enzymatic nucleic acids such as harmerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes, Also disclosed are nucleic acid decory molecules and apramers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds compounds of the invention and/or replication of HCV. The compounds disease states related to HBV and HCV infection, replication and gene actions and active and HBV and HCV infection, replication and gene actions. The present sequence represente a substrate for one of the HBV enzymatic nucleic acid sequence alsolved in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes a method of determining presence or absence of a desired nucleic acid (NA) that contains multiple repeats of a predetermined NA target sequence in a NA sample. The method involves providing a treated sample that may contain the desired NA in which several predetermined repeating NA target sequences are hybridised with a contain providing a treated sample that may contain the desired NA. The method containing the NA probe, and thereby the presence of absence of the desired NA. The method is useful for determining the presence or absence of desired nucleic acids that contain multiple repeats of a predetermined NA target sequence, in a NA sample obtained from a biological sample, where the repeated sequence innultiple several predetermined repeated sequence that confirming human and bacterial NA. The method is highly sensitive, and enables detection and quantification of the presence of a NA without the need to undergo a NA target sequence enrichment step prior to a NA hybrid detection step. The method enables rapid and accurate detection of a desired NA that contains multiple repeats of a NA target sequence. This detection of a desired NA that contains multiple repeats of a NA target sequence. The sequence represents a probe used to detect the human Alu repeat sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                Determining presence or absence of desired nucleic acids that contain multiple repeats of predetermined nucleic acid target sequences in a sample, by using nucleic acid hybridization methods.

The present invention describes a method for typing at least two variable sites of at least one nucleic acid molecule related to cystic fibrosis.

The method comprises: (a) providing at least one extension of agene related to cystic fibrosis; (b) providing at least one extension primer, which binds to different predetermined sites in the nucleic acid molecule of at least two potential variable sites in the nucleic acid molecule, and nucleotide; (c) simultaneously or sequentially performing primer at least two potential variable sites in the nucleotide, and nucleotide; (c) simultaneously or sequentially performing primer cartension reactions; and (d) determining the pattern of nucleotide conforming the pattern of step (c) with one or more reference pattern of nucleotide pattern of step (c) with one or more reference patterns, in order to type the variable sites of the nucleic acid molecules. Also described: (1) pattern of step (c) with one or more reference described: (1) response related to the human cystic fibrosis transmembrane conductance response related to the human cystic fibrosis transmembrane conductance comparising at least one extension primer. The method is useful for typing comprising at least one extension primer. The method is useful for typing the least two variable sites of at least one nucleic acid molecule related to cystic fibrosis. The present sequence represents an oligonucleoride which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0

Typing at least two variable sites of at least one nucleic acid molecule related to cystic fibrosis by simultaneously or sequentially performing primer extension reactions and determining the pattern of nucleotide incorporation.
                                                                                                                                                                Example 6; Fig 3; 69pp; English

The present invention describes a method for typing at least two variable sites of at least one nucleic acid molecule related to cystic fibrosis. The method comprises: (a) providing at least one nucleic acid molecule of a gene related to cystic fibrosis; (b) providing at least one extension primer, which binds to different predetermined sites in the nucleic acid molecules, where at least one extension primer is designed to extend over at least two potential variable sites in the nucleic acid molecule, and nucleotide; (c) simultaneously or sequentially performing primer extension reactions; and (d) determining the pattern of nucleotide incorporation to obtain a test pattern; optionally (e) comparing the test pattern of step (c) with one or more reference patterns, in order to type the variable sites of the incleic acid molecules. Also described: (1) diagnosing the genetic predisposition of states, diseases and drug response related to the human cystic fibrosis transmembrane conductance regulator (CFTR) gene, and (2) a kit for use in the method for typing comprising at least one extension primer. The method is useful for typing at least two variable sites of at least one nucleic acid molecule related to cystic fibrosis. The present sequence represents an oligonucleotide which is used in the exemplification of the present invention.
